

Power BI Report I developed showing Profit by Product Type

- Using Sample Data from multiple data sources
- Created Dates Table so data is accurately displayed
- Created the following DAX expressions
 - **Total Profit** = (Sum('Apocalypse Store'[Price]) - Sum('Apocalypse Store'[Production Cost])) * Sum('Apocalypse Sales'[Units Sold])
 - **Profit Per Product** = SUMX(RELATEDTABLE('Apocalypse Sales'), 'Apocalypse Sales'[Units Sold] * ('Apocalypse Store'[Price] - 'Apocalypse Store'[Production Cost]))
